What is erectile dysfunction (ED)?

Erectile dysfunction (ED) is the inability to get or keep an erection firm enough to have sexual intercourse. It's also sometimes referred to as impotence.

Occasional ED isn't uncommon. Many men experience it during times of stress. Frequent ED can be a sign of health problems that need treatment. It can also be a sign of emotional or relationship difficulties that may need to be addressed by a professional.

Not all male sexual problems are caused by ED. Other types of male sexual dysfunction include:

- premature ejaculation
- delayed or absent ejaculation

- lack of interest in sex

What are the symptoms of ED?

You may have erectile dysfunction if you regularly have:

- trouble getting an erection
- difficulty maintaining an erection during sexual activities
- reduced interest in sex

Other sexual disorders related to ED include:

- premature ejaculation
- delayed ejaculation
- anorgasmia, which is the inability to achieve orgasm after ample stimulation

You should talk to your doctor if you have any of these symptoms, especially if they've lasted for two or more months.

Your doctor can determine if your sexual disorder is caused by an underlying condition that requires treatment.

*An analysis of research on ED in men under 40 found that smoking was a factor for ED among 41 percent of men under the age of 40. Diabetes was the next most common risk factor and was linked to ED in 27 percent of men under 40. When a man becomes sexually excited, muscles in their penis relax. This relaxation allows for increased blood flow through the penile arteries. This blood fills two chambers inside the penis called the corpora cavernosa. As the chambers fill with blood, the penis grows rigid. Erection ends when the muscles contract and the accumulated blood can flow out through the penile veins.*
